Fish Descriptions

Bluegill

Bluegill feed almost exclusively on insects and will also eat commercial fish food. Bluegills begin to spawn in late spring and will spawn 3-4 times throughout the summer. These spawns are primarily used as a forage base for predators, such as large-mouth bass. One year old fish range in size from 1 - 4 inches and become sexually mature between 4 - 5 inches.

Hybrid Bluegill

Hybrid bluegill is a cross between a green sunfish and a bluegill. They grow faster than regular bluegill. They will also eat commercial food. Their spawning habits are like the bluegill however they produce less eggs. One year old range in size from 3 - 8 inches. They become sexually mature at 4 - 5 inches.

Black Crappie

Crappie prefer cover, such as vegetation, fallen trees or boulders. They often form in large groups, called schools, in clear water among vegetation over mud or sand. They inhabit quiet, warm temperate waters; usually associated with abundant aquatic vegetation and sandy to muddy bottoms. The common length for black crappie is 10.8 inches and the maximum reported length for a black crappie is 19.3 inches

Channel Catfish

Channel Catfish are scavengers that will eat almost anything and are primarily found at the bottom of a pond or lake. They will easily take to commercial feed which results in tremendous growth. They generally do not reproduce in ponds due to inadequate spawning structure. Suitable structures are buckets or drain tiles placed in 3 - 4 foot water depths.

Fathead Minnow

Black Fathead Minnows are added to ponds as a source of food for other species. They can spawn many times throughout the spring and summer. The use of stacked pallets and trees can create spawning habitats. One year olds range in size from .5 - 3 inches and become sexually mature at 1 - 3 inches. Restocking is necessary if none are visible in pond.

Large Mouth Bass

Large Mouth Bass, one of the most prized game fish, do not readily feed on commercial fish food. They eat insects, tadpoles, minnows and other small fish. They spawn in 2 - 4 feet of water at temperatures near 60 degrees. One year old fish range in size between 3 - 7 inches and become sexually mature at 10 - 12 inches.

Redear Shellcracker

The redear sunfish nicknamed the Shellcracker, is a member of the sunfish family and similar to the bluegill. It feeds almost exclusively on mollusks. These are fast growing and fun to catch. They reproduce one time a year therefore they will not overpopulate a pond. One year olds range from 1 - 4 inches and become sexually mature between 5 - 9 inches.

White Amur

White Amur, or the Grass Carp, is a cost effective, natural alternative for weed control in ponds. The use of amur in place of chemical applications is more environmentally friendly. Once an amur reaches maturity it consumes less, therefore 20% of the original stocking should be added annually. They can eat up to 3 times its body weight per day. These fish are sterile due to government regulations to avoid overpopulation.

Yellow Perch

Yellow Perch is sought after for the good tasting filets. Their primary food is zooplankton, insects, snails and small fish. They are considered prey rather than predators. Reproduction occurs on tree-like structures in water depths of 1 - 6 feet. One year old fish range in size from 1 - 4 inches and become sexually mature at 5 - 12 inches.
